Comparison of popular CSS frameworks

Reasons to consider Tailwind

- You feel constrained by Bootstrap / Bulma
- You'd like a middle ground between full-blown Framework and raw CSS
- You'd like consistency and DRYness across your styles
- You don't mind a little up-front tinkering to set things up however you like
- Your styling is very specific and doesn't easily conform to the pre-fab components / elements provided by other frameworks

What Tailwind ISN'T

- A UI Kit
- A set of pre-built components
- A theme skinner
- Opinionated

What Tailwind IS

- A fully configurable set of component classes that allow rapid assembly of common CSS concepts (border, padding, color, font)
- A bit like old school legos. Just a bunch of bricks, how you assemble them is up to you.
- Composable
- DRY
- Consistent
